Stem Studio

Separate an audio file you have permission to use into five practice stems. Listen to the vocal, drum, bass, piano/instrument and backing stems to prepare your rehearsal mix.

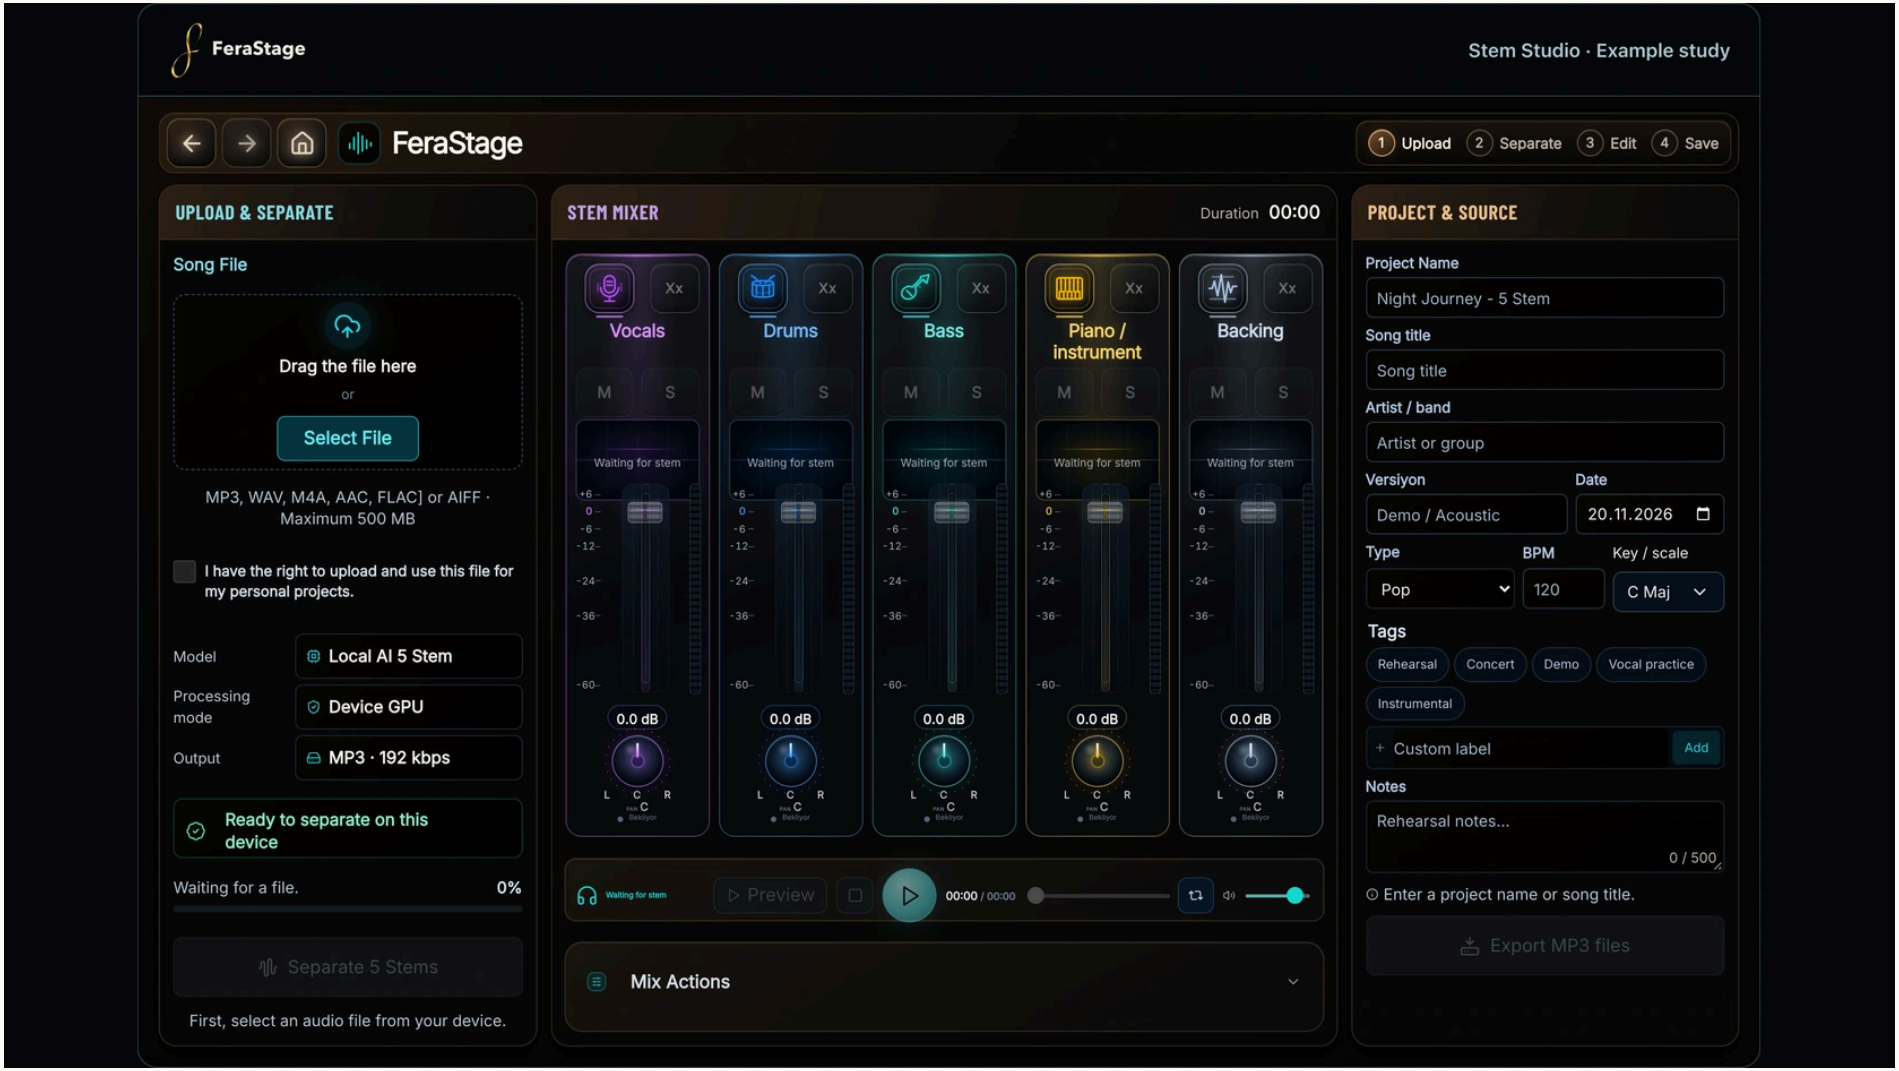
Get started in three steps

1. Select your audio file, confirm your right to use it and check that the device is ready.
2. Choose Separate 5 Stems. When processing finishes, practice with the stems using solo and mute.
3. Add project details, then export your mix and the five stems as MP3 files or a ZIP archive.

Usage notes

- Processing time and availability depend on the device's CPU/GPU, memory, browser and storage support.
- An internet connection may be needed on first use to prepare the local model and working files.
- Cloud processing and cloud backup are disabled in the current version.
- Clearing browser or site data may delete local projects. Export your files to keep a copy.
- The fader in the Export Studio changes the listening level only.

Stem Studio · Product visual



An earlier promotional illustration for Stem Studio. The instructions below describe the current five-stem interface.

Stem Studio · Five-stem workspace

Vocal, Drums, Bass, Piano / Instrument and Backing stems. File separation has not started in this sample view.

Practice ideas

1. **Five-Part View**
   Learn how the five stems fit into your practice.

2. **Vocal Focus**
   Practice the vocal line separately from the other stems.

3. **Vocal Rehearsal**
   Prepare a rehearsal mix without the lead vocal for singing practice.

4. **Drum Rehearsal**
   Prepare a mix so you can play the drum part yourself.

5. **Bass Focus**
   Hear the bass line on its own and compare it with the full song.

Practice ideas

6. **Balance Study**
   Balance the stems for rehearsal.

7. **Stereo Space**
   Adjust a stem’s position in the stereo field.

8. **Three-Band EQ**
   Explore a stem’s EQ settings.

9. **Organized Session**
   Turn project details into a clear practice record.

10. **Rehearsal Package**
    Export the five stems and Final Mix files.
